EXPLANATIONS

REGARDING PRONUNCIATION AND CHEMICAL SYMBOLS.

PRONUNCIATION.

IN showing the pronunciation the simplest and most easily understood method has been adopted, that of *re-writing* the word in a different form. In doing so the same letter or combination of letters is made use of for the same *sound*, no matter by what letter or letters the sound may be expressed in the principal word. The *key* by this means is greatly simplified, the reader having only to bear in mind one mark for each sound.

Vowels.

ā, as in fate.	o, as in not.
ā, " far.	ō, " move.
a, " fat.	ū, " tube.
ā, " fall.	u, " tub.
e, " me.	ū, " bull.
e, " met.	ū, " Sc. abune (Fr. u).
é, " her.	oi, " oil.
i, " pine.	ou, " pound.
i, " pin.	y, " Sc. ley (= e + i).
ō, " note.	

Consonants.

eh, . . as in . . chain.	th, as in then.
ch, . . " . . " . . Sc. loch, Ger. nacht.	th, " thin.
j, " job.	w, " wig.
g, " go.	wh, " whig.
h, " Fr. ton.	zh, " azure.
ng, . . " . . " . . sing.	

The application of this key to the pronunciation of foreign words can as a rule only represent approximately the true pronunciation of those words. It is applicable, however, to Latin and Greek words, as those languages are pronounced in England.

Accent.—Words consisting of more than one syllable receive an accent, as the first syllable of the word *labour*, the second of *delay*, and the third of *comprehension*. The accented syllable is the most prominent part of the word, being made so by means of the accent. In this dictionary it is denoted by the mark '. This mark, called an accent, is placed above and beyond the syllable which receives the accent, as in the words *la'bour*, *de'lay*, and *comprehen'sion*.

Many polysyllabic words are pronounced with two accents, the primary and the secondary accent, as the word *excommunication*, in which the third, as well as the fifth syllable is commonly accented. The accent on the fifth syllable is the primary, true, or tonic accent, while that on the third is a mere euphonic accent, and consists of a slight resting on the syllable to prevent indistinctness in the utterance of so many unaccented syllables. Where both accents are marked in a word, the primary accent is thus marked ', and the secondary, or inferior one, by this mark ' , as in the word *excommu'nica'tion*.

CHEMICAL ELEMENTS AND SYMBOLS.

By means of chemical symbols, or formulas, the composition of the most complicated substances can be very easily expressed, and that, too, in a very small compass. An abbreviated expression of this kind often gives, in a single line, more information as to details than could be given in many lines of letterpress.

When any of the above symbols stands by itself it indicates one atom of the element it represents. Thus, H stands for one atom of hydrogen, O for one atom of oxygen, and Cl for one atom of chlorine. (See *ATOM*, and *Atomic theory* under *ATOMIC*, in Dictionary.)

When a symbol has a small figure or number underwritten, and to the right of it, such figure or number indicates the number of atoms of the element. Thus—O₂ signifies two atoms of oxygen, S₅ five atoms of sulphur, and C₁₀ ten atoms of carbon.

When two or more elements are united to form a chemical compound, their symbols are written one after the other, to indicate the compound. Thus—H₂O means water, a compound of two atoms of hydrogen and one of oxygen; C₁₂H₂₂O₁₁ indicates cane-sugar, a compound of twelve atoms of carbon, twenty-two of hydrogen, and eleven of oxygen.

These two expressions as they stand denote respectively a molecule of the substance they represent, that is, the smallest possible quantity of it capable of existing in the free state. To express several molecules a large figure is prefixed, thus: 2 H₂O represents two molecules of water, 4 (C₁₂H₂₂O₁₁) four molecules of cane-sugar.

When a compound is formed of two or more compounds the symbolical expressions for the compound are usually connected together by a comma; thus, the crystallized magnesian sulphate is MgSO₄, 7 H₂O. The symbols may also be used to express the changes which occur during chemical action, and they are then written in the form of an equation, of which one side represents the substances as they exist before the change, the other the result of the reaction. Thus, 2 H₂ + O₂ = 2 H₂O expresses the fact that two molecules of hydrogen, each containing two atoms, and one of oxygen, also containing two atoms, combine to give two molecules of water, each of them containing two atoms of hydrogen and one of oxygen.

SCREAM

Scream (skrēm), *v.i.* [Comp. Icel. *skramska*, to scream; probably imitative, like *screech*, *shriek*, &c.] 1. To cry out with a shrill voice; to utter a sudden, sharp outcry, as in a fright or in extreme pain; to utter a shrill, harsh cry; to shriek.

I heard the owl *scream* and the crickets cry.
So sweetly *screams* if it (a mouse) comes o'er her,
She ravishes all hearts to hear her.

2. To give out a shrill sound; as, the railway whistle *screamed*.

Scream (skrēm), *n.* 1. A shriek, or sharp shrill cry uttered suddenly, as in terror or in pain. 'Screams of horror rend the affrighted skies.' *Pope*.—2. A sharp, harsh sound. 'The scream of a madden'd beach dragg'd down by the wave.' *Tennyson*.

Screamer (skrēm'ér), *n.* 1. One that screams. 2. A name given to two species of South American gallatorial birds, the *Palamedea cornuta* and *Oahuia chavaria*. They are remarkable for their harsh and discordant voices, and for the sharp hard spurs with which the wings are armed. See *PALAMEDA*.—3. Something very great; a whacker; a bouncing fellow or girl. [Slang.]

Screaming (skrēm'ing), *p. and a.* 1. Crying or sounding shrilly.—2. Causing a scream; as, a *screaming* farce, one calculated to make the audience scream with laughter.

Scree (skrē), *n.* [Comp. Icel. *skriða*, a landslip on a hill-side.] A small stone or pebble; in the *pl.* debris of rocks; shingle; a talus; accumulations of loose stones and fragments at the base of a cliff or precipice. 'Grey calms and *scree*s of granite.' *Kingsley*.

Before I had got half way up the *scree*s, which gave way and rattled beneath me at every step.

Screech (skrēch), *v.i.* [A softened form of *screak* (which see), Icel. *skrækja*, *skrækta*, to *screech*, *skrækja*, a *screech*, Sw. *skrika*, Dan. *skrige*, to *screech*: an imitative word; comp. Sc. *scraich*, Gael. *sgreach*, W. *ysgrechïaw*, to *screech*.] To cry out with a sharp, shrill voice; to *scream*; to *shriek*. 'The *screech-owl* *screeching* loud.' *Shak*.

These birds of night . . . *screeched* and clapped their wings for a while.

Screech (skrēch), *n.* 1. A sharp, shrill cry, such as is uttered in acute pain or in a sudden fright; a harsh scream. 'The birds obscene . . . with hollow *screeches*.' *Pope*.

A *screech* or shriek is the cry of terror or passion; perhaps it may be called sharper and harsher than a scream; but, in human beings especially, scarcely to be distinguished from it.

2. A sharp, shrill noise; as, the *screech* of a railway whistle.

Screech-owl (skrēch'oul), *n.* An owl that utters a harsh, disagreeable cry at night, formerly supposed to be ominous of evil; an owl, as the barn-owl, that *screeches*, in opposition to one that hoots.

The *screech-owl*, prophet dire.

Screechy (skrēch'ly), *a.* Shrill and harsh; like a *screech*. *Cockburn*.

Screed (skrēd), *n.* [Prov. E. *screed*, a shred, A. Sax. *scradde*, ashred. See next entry.] In *plastering*, (a) a strip of mortar of about 6 or 8 inches wide, by which any surface about to

be plastered is divided into bays or compartments. The *screeds* are 4, 5, or 6 feet apart, according to circumstances, and are accurately formed in the same plane by the plumb-rule and straight-edge. They thus form gauges for the rest of the work, the interspaces being latterly filled out flush with them. (b) A strip of wood similarly used.

Screed (skrēd), *n.* [A form of *shred*; a Scotch word. See above.] 1. The act of rending or tearing; a rent; a tear. *Burns*.—2. That which is rent or torn off; as, a *screed* of cloth. 3. A piece of poetry or prose; a harangue; a long tirade upon any subject.—A *screed o' drink*, a drinking bout. *Sir W. Scott*.

Screed (skrēd), *v.t.* [Sc. See the noun.] 1. To rend; to tear.—2. To repeat glibly; to dash off with spirit. *Burns*.

Screeket (skrēk), *v.i.* Same as *Scream*.

Screen (skrēn), *n.* [O. Fr. *ecran*, *escrein*, *escran*, Fr. *écran*, a screen, perhaps from O. H. G. *skranna*, a bench, a table.] 1. An appliance or article that shelters from the sun, rain, cold, &c., or from sight; a kind of movable framework or partition, often hinged so that it may be opened out more or less as required, or be folded up to occupy less space, used in a room for excluding cold, or intercepting the heat of a fire. 'Your leafy *screens*.' *Shak*.

Our fathers knew the value of a *screen*
From sultry suns.

2. That which shelters or protects from danger; that which hides or conceals, or which prevents inconvenience.

Some ambitious men seem as *screens* to princes in matters of danger and envy.

3. A kind of riddle or sieve; more especially, (a) a sieve used by farmers for sifting earth or seeds. (b) A kind of wire sieve for sifting

Builder's Screen.

sand, lime, gravel, &c. It consists of a rectangular wooden frame with wires traversing it longitudinally at regular intervals. It is propped up in nearly a vertical position, and the materials to be sifted or screened are thrown against it, when the finer particles pass through and the coarser remain. A similar apparatus is used for separating lump coal from the small coal and dross, and also for sorting crushed ores, &c.—4. In *arch.* (a) a partition of wood, stone, or metal, usually so placed in a church

as to shut out an aisle from the choir, a private chapel from a transept, the nave from the choir, the high altar from the east end of the building, or an altar tomb from a public passage of the church. See *PARCLOUSE*. (b) In medieval halls, a partition extending across the lower end, forming a lobby within the main entrance doors, and having often a gallery above. (c) An architecturally decorated wall, inclosing a courtyard in front of a building.—5. *Naut.* the name given to a piece of canvas hung round a berth for warmth and privacy.

Screen (skrēn), *v.t.* [From the noun.] 1. To shelter or protect from inconvenience, injury, or danger; to cover; to conceal; as, our houses and garments *screen* us from cold; an umbrella *screens* us from rain and the sun's rays; to *screen* a man from punishment.

Back'd with a ridge of hills,
That *screen'd* the fruits of th' earth.

2. To sift or riddle by passing through a screen; as, to *screen* coal.

Screening-machine (skrēn'ing-ma-shēn), *n.* An apparatus, having a rotary motion, used for screening or sifting coal, stamped ores, and the like.

Screenings (skrēn'ingz), *n. pl.* The refuse matter left after sifting coal, &c.

Screigh-of-day (skrēch-ov-dā), *n.* [Comp. D. *krieken van den dag*, peep of day; *krieken*, to peep, to chirp.] The first dawn. [Scotch.]

Screw (skrō), *n.* [Same word as Dan. *skrive*, Sw. *skruf*, Icel. *skrifa*, D. *schroef*, O. D. *schroeve*, L. G. *schruibe*, G. *schraube*, a screw. Or perhaps from O. Fr. *escroue*, the hole in which a screw turns, Mod. Fr. *écrou*, which Littré regards as from one or other of the above words, but Diez, rather improbably, derives from L. *scrobo*, *scrobis*, a trench. The word does not appear very early in English. Shakspeare uses the verb, and no doubt the noun was familiar before this.] 1. A cylinder of wood or metal having a spiral ridge (the thread) winding round it in a uniform manner, so that the successive turns are all exactly the same distance from each other, and a corresponding spiral groove is produced. The screw forms one of the six mechanical powers, and is simply a modification of the inclined plane, as may be shown by cutting a piece of paper in the form of a right-angled triangle, so as to represent an inclined plane, and applying it to a cylinder with the perpendicular side of the triangle, or altitude of the plane, parallel to the axis of the cylinder. If the triangle be then rolled about the cylinder, the hypotenuse which represents the length of the plane will trace upon the surface of the cylinder a spiral line, which, if we suppose it to have thickness, and to protrude from the surface of the cylinder, will form the thread of the screw. The energy of the power applied to the screw thus formed is transmitted by means of a hollow cylinder of equal diameter with the solid or convex one, and having a spiral channel cut on its inner surface so as to correspond exactly to the thread raised upon the solid cylinder. Hence the one will work within the other, and by turning the convex cylinder, while

the other remains fixed, the former will pass through the latter, and will advance every revolution through a space equal to the distance between two contiguous turns of the thread. The convex screw is called the *external* or *male*, and the concave or hollow screw the *internal* or *female* screw, or they are frequently termed simply the screw and nut respectively. As the screw is a modification of the inclined plane it is not difficult to estimate the mechanical advantage obtained by it. If we suppose the power to be applied to the circumference of the screw, and to act in a direction at right angles to the radius of the cylinder, and parallel to the base of the inclined plane by which the screw is supposed to be formed; then the power will be to the resistance as the distance between two contiguous threads to the circumference of the cylinder. But as in practice the screw is combined with the lever, and the power applied to the extremity of the lever, the law becomes: The power is to the resistance as the distance between two contiguous threads to the circumference described by the power. Hence the mechanical effect of the screw is increased by lessening the distance between the threads, or making them finer, or by lengthening the lever to which the power is applied. The law, however, is greatly modified by the friction, which is very great. The uses of the screw are various. It is an invaluable mechanism for fine adjustments such as are required in good telescopes, microscopes, micrometers, &c. It is used for the application of great pressure, as in the screw-jack and screw-press; as a borer, in the gimlet; and in the ordinary screw nail we have it employed for fastening separate pieces of material together.—*Archimedean screw*. See ARCHIMEDEAN.—*Endless screw* or *perpetual screw*. See under ENDLESS.—*Right and left screw*, a screw of which the threads upon the opposite ends run in different directions.—*Hunter's screw* consists of a combination of two screws of unequal fineness, one of which works within the other, the external one being also made to play in a nut. In this case the power does not depend upon the interval between the threads of either screw, but on the difference between the intervals in the two screws. See HUNTER'S SCREW, and *Differential screw* under DIFFERENTIAL.—*Screw propeller*, an apparatus which, being fitted to ships and driven by steam, propels them through the water, and which, in all its various forms, is a modification of the common screw. Originally the thread had the form of a broad spiral plate, making one convolution

round the spindle or shaft, but now it consists of several distinct blades. The usual position for the screw propeller is immediately before the stern-post, the shaft passing parallel to the keel, into the engine-room, where it is set in rapid motion by the steam-engines. This rotatory motion in the surrounding fluid, which may be considered to be in a partially inert condition, produces, according to the well-known principle of the screw, an onward motion of the vessel more or less rapid, according to the velocity of the shaft, the obliquity of the arms, and the weight of the vessel. The annexed figure shows a somewhat rare form of the screw propeller.—*Screw nails* and *wood screws*, a kind of screws very much used by carpenters and other mechanics for fastening two or more pieces of any material together. When they are small they are turned by means of an instrument called a *screw-driver*.—*Screw wrench* or *key*, a mechanical instrument employed to turn large screws or their nuts.—2. One who makes a sharp bargain; an extortioner; a miser; a

skin-flint.—3. An unsound or broken-down horse. [Colloq.]—4. A small parcel of tobacco twisted up in a piece of paper, somewhat in the shape of a screw.—5. A steam-vessel propelled by means of a screw.—6. A screw-shell (which see).

His small private box was full of peg-tops . . . screws, birds' eggs, &c. T. Hughes.

7. The state of being stretched, as by a screw. 'Strained to the last screw he can bear.' Cooper.—8. Wages or salary. [Slang.]—A *screw loose*, something defective or wrong with a scheme or individual.

My uncle was confirmed in his original impression that something dark and mysterious was going forward, or, as he always said himself, that there was a screw loose somewhere. Dickens.

—To *put on the screw*, to bring pressure to bear (on a person), often for the purpose of getting money.—To *put under the screw*, to influence by strong pressure; to compel; to coerce.

Screw (skrô), *v. t.* 1. To turn, as a screw; to apply a screw to; to move by a screw; to press, fasten, or make firm by a screw; as, to *screw* a lock on a door; to *screw* a press. 2. To force as by a screw; to wrench; to squeeze; to press; to twist.

Scythe (sith), *n.* [Better written *sithe*; A. Sax. *sithe* for *sithe*, Icel. *sith*; from root of *sickle*.] 1. An instrument used in mowing or reaping, consisting of a long curving blade with a sharp edge, made fast at a proper angle to a handle, which is bent into a convenient form for swinging the blade to advantage. Most scythes have two projecting handles fixed to the principal handle, by which they are held. The real line of the handle is that which passes through both the hands, and ends at the head of the blade. This may be a straight line or a crooked one, generally the latter, and by moving these handles up or down the main handle, each mower can place them so as best suits the natural size and position of his body. For laying out corn evenly, a cradle, as it is called, may be used. The cradle is a species of comb, with three or four long teeth parallel to the back of the blade, and fixed in the handle. Fig. 2 shows a species of scythe which has been called the cradle-scythe, as it is regularly used with the cradle for reaping in some localities. It has a short branching handle somewhat in the shape of the letter Y, having two small handles fixed at the extremities of the two branches at right angles to the plane in which they lie. The Hainault scythe is a scythe used with only one hand, and is employed when the corn is much laid and entangled. The person has a hook

These tentacula, when expanded, give the animals somewhat the appearance of flowers. They may be very numerous, in some cases exceeding 200 in number, and are as a rule capable of being retracted within the body when the animal is irritated. When fully expanded the appearance of the sea-anemones in all their varieties of colour is exceedingly beautiful. origin doubtful.] The name given generally to mammals of certain genera belong-

ing to the order Carnivora and to the section Pinnigrada, which differ from the typical carnivores merely in points connected with their semiaquatic mode of life. The seals are divided into two families—the Phocidae, or common seals, which have no external ear; and the Otariidae, or eared seals, which include the sea-bear, sea-lion, and other forms. Species are found in

Hooded or Crested Seal (*Cystophora cristata*).

almost every sea out of the limits of the tropics, but they especially abound in the seas of the arctic and antarctic regions. The body is elongated and somewhat fish-like in shape, covered with a short dense fur or coarse hairs, and terminated behind by a short conical tail. The Phocidae have their hind-feet placed at the extremity of the body, and in the same line, so as to serve the purpose of a caudal fin; the fore-feet are also adapted for swimming, and furnished each with five claws. They are largely hunted for their fur and blubber, a valuable oil being obtained from the latter; and to the Esquimaux they not only furnish food for his table, oil for his lamp, and clothing for his person, but even the bones and skins supply material for his boats and his summer tents. There are numerous species. The common seal (*Phoca vitulina*) is not uncommon on British coasts. It averages about 4 feet in length, and its fur is grayish-brown, mottled with black. It is easily tamed, and soon becomes attached to its keeper or those who feed it. Closely allied to the common seal is the marbled seal (*P. discolor*) found on the coast of France. The *P. greenlandica* (harp-seal or saddle-back seal) forms the chief object of pursuit by the seal-fishers, and has its familiar name from a black or tawny mark on the back, resembling a harp in shape, the body fur being gray. The great seal (*P. barbata*) measures from 8 to 10 feet in length, and occurs in southern Greenland. The gray seal (*Halicharus griseus*) frequents more southern regions than the preceding and attains a length of from 8 to 9 feet. The smallest of the Greenland seals, *P. fetida*, is so called because of the disagreeable odour emitted by the skin of old males. A species of the genus *Phoca*, known as the *P. caspica*, is found in the Caspian Sea, and also in the Siberian lakes Aral and Baikal. The crested seal (*Cystophora cristata*) is common on the coasts of Greenland, &c. The so-called crest is a bladder-like bag capable of being inflated with air from the animal's nostrils. The Otariidae, or eared seals, have a small external ear, and the neck is much better defined than in the Phocidae. They are also able to move about on land with greater ease, owing to the greater freedom of the fore-limbs. The best known forms are the *Otaria ursina* (sea-bear) and *Otaria jubata* (sea-lion). The famous under fur which forms the valued 'seal-skin' is obtained from species of the Otariidae. See *SEA-BEAR*, *SEA-ELEPHANT*, *SEA-LION*.

It may attack on smooth waters, while a rough sea may fail to produce it. It may pass away after the lapse of a few hours, or last during a whole voyage. One good authority explains it as an undue accumulation of the blood in the nervous centres along the back, and especially in those segments of the spinal cord related to the stomach and the muscles concerned in vomiting, and recommends as the best remedy against it the application of ice-bags to the spinal column. In some cases its violence may be considerably mitigated by iced brandy, by small doses of opium, by soda-water, or by saline draughts in the effervescent state.

Self (self). [*A. Sax. self*, *selfa*, a pronominal word common to the Teutonic tongues; O. Sax. *self*, D. *zelf*, Dan. *selv*, Icel. *sjálf*, G. *selb*, *selbst*, Goth. *silba*; probably formed by compounding the reflexive pronoun *se*, *si* (=I. *se*), seen in Icel. *se*, to himself, *sik*, self, G. *sich*, with some other word. In the oldest English (*A. Sax.*) as well as later *self* was a kind of pronominal adjective, most commonly used after the personal pronouns, but also, in the sense of same, standing before nouns, quite like an adjective. Thus the following forms occur: *ie self*, or *ic selfa*, I myself; *min selfes*, of myself; *mē selfum*, to myself; *me selfne* (acc.), myself; *thū selfa*, thyself; *he selfa*, himself; *wē selfe*, we ourselves; on *thām sylfan gedre*, in that same year, &c. The dative of the personal pronoun was also prefixed to *self*, the latter being undeclined, as *ic me self*, I myself; *he him self*, he himself; and these forms gradually led to the forms *myself*, *thyself*, *ourselves*, *yourselves*, &c., in which the genitive or possessive form is prefixed to *self*. After this it was not unnatural for *self* to be often regarded as a noun with the plural *selves*, like other nouns ending in *f*. In *himself*, *themselves*, the old dative is still retained.] A pronominal element affixed to certain personal pronouns and pronominal adjectives to express emphasis or distinction; also when the pronoun is used reflexively. Thus for emphasis, I *myself* will write; I will examine for *myself*. Thou *thyself* shalt go; thou shalt see for *thyself*. The child *itself* shall be carried; it shall be present *itself*. Reflexively, I *abhor myself*; he *loves himself*; it *pleases itself*; we *value ourselves*. Except when added to pronouns used reflexively, *self* serves to give emphasis to the pronoun, or to render the distinction expressed by it more emphatical. 'I *myself* will decide,' not only expresses my determination to decide, but the determination that no other shall decide. *Himself*, *herself*, *themselves*, are used in the nominative case, as well as in the objective.

Jesus *himself* baptized not, but his disciples. *Ja. iv. 2.* Sometimes *self* is separated from *my*, *thou*, &c., as, *my wretched self*; 'To our gross *selves*' (*Shak.*); and this leads to the similar use of *self* with the possessive case of a noun; as, 'Tarquin's *self*' (*Shak.*), giving *self* almost the character of a noun, which it fully takes in such cases as are illustrated in next article.

Alexandrian senna (*Senna Alexandrina*) consists of the lance-shaped leaflets of *C. lanceolata* and the obovate ones of *C. obovata*, carefully freed from the flowers, pods, and leaf-stalks. It is grown in Nubia and Upper Egypt, and imported in large bales from Alexandria. It is liable to be adulterated by an admixture of the leaves, flowers, and fruit of the argel (*Solenostemma Argel*). Tinnevely or East Indian senna (*Senna Indica*) is a very fine kind, and consists of the large lance-shaped leaflets of *C. elongata*. The leaflets of *C. obovata* are from their shape called also *blunt-leaved senna*, and from their place of export *Aleppo senna*. The true senna leaves are distinctly ribbed and thin, and generally pointed, and are readily distinguished from the leaves of argel by their unequally oblique base and

their freedom from bitterness. Senna is a general and efficient laxative in cases of occasional or habitual constipation. Given alone it occasions griping and nausea; it is therefore best administered with aromatics or with neutral laxative salts, which at the same time increase its activity. It is used in dyspepsia and in febrile and inflammatory diseases; but, as it is sometimes drastic, it must be avoided when the alimentary canal is much affected.—*Bladder senna*, the *Coletea arborescens*, a native of the south of Europe, and employed to adulterate blunt-leaved senna.—*Scorpion senna*, the *Coronilla Emerus*, a native of the south of Europe. The leaves are purgative and drastic, but are inconvenient on account of their gripping effects.

Senna (*Cassia lanceolata*).

cognized as a distinct class, differing materially from the sensations of the five senses. They have been regarded by some metaphysicians as proceeding from a sense apart, a sixth or muscular sense, and have accordingly been enrolled under the general head of sensations. The *Sepia officinalis*, so common in the Mediterranean, is chiefly sought after on account of the profusion of colour which it affords. The secretion, which is insoluble in water, but extremely diffusible through it, is agitated in water to wash it, and then allowed slowly to subside, after which the water is poured off, and the black sediment is formed into cakes or sticks. In this form it is used as a common writing ink in China, Japan, and India. The *sept* was known by a second name, the *fine* or *Family*, and it was evidently a distinct organic group in the main connected by the ties of blood, and claiming descent from a common ancestor, yet certainly containing other elements introduced by adoption and like processes. It is reported by Josephus to have been made in the reign and by the order of Ptolemy Philadelphus, king of Egypt, about 270 or 280 years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually. The Septuagint came to be very widely used, even among the Jews, and is the source from which most of the citations in the New Testament from the Old are taken. It is an invaluable help to the right understanding of the Hebrew Scriptures.

It has two mirrors, one of which is fixed to a movable index, and various other appendages. It is capable of very general application, but it is chiefly employed as a nautical instrument for measuring the altitudes of celestial objects, and their apparent angular distances. The principle of the sextant, and of reflecting instruments in general, depends upon an elementary theorem in optics, viz. if an object be seen by repeated reflection from two mirrors which are perpendicular to the same plane, the angular distance of the object from its image is double the inclination of the mirrors. The annexed figure shows the usual construction of the sextant. QP is the graduated arc, BI the movable index, B mirror fixed to the index, A mirror (half-silvered, half-transparent) fixed to the arm, GG' coloured glasses, that may be interposed to the sun's rays. To find the angle between two stars hold the instrument so that the one is seen directly through telescope T and the unsilvered portion of the mirror, and

move the index arm so that the image of the other star seen through the telescope by reflection from B and A is nearly coincident with the first, the reading on the arc gives the

Sextant.

angle required; half degrees being marked as degrees, because what is measured by the index is the angle between the mirrors and this is half that between the objects.—*Box sextant*, a surveyor's instrument for measuring angles, and for filling in the details of a survey, when the theodolite is used for the long lines, and laying out the larger triangles.—3. They lead a celibate life, hold their property in common, engage in agriculture, horticulture, and a few simple trades. They believe the millennium has come, that they hold communication with the spirits of the departed, and have the exercise of spiritual gifts. They wear a peculiar dress, and abstain from the use of pork as food. They teach the theory of non-resistance as opposed to war and bloodshed. They are now mostly confined to the United States of America. Sometimes called *Shaking Quaker*.—3. A variety of pigeon.

2. In *geol.* a species of schist or schistous clay; slate clay; generally of a bluish or yellowish gray colour, more rarely of a dark blackish or reddish gray, or grayish black, or greenish colour. Its fracture is slaty, and in water it moulders into powder. It is often found in strata in coal-mines, and commonly bears vegetable impressions. It is generally the forerunner of coal. Bituminous shale is a sub-variety of argillaceous slate, is impregnated with bitumen, and burns with flame. It yields, when distilled at a low red heat, an oil of great commercial importance, to which, from its being rich in paraffin, the name of paraffin-oil has been given. The coal-measures of Linlithgowshire are especially rich in bituminous shales of great value. Alum also is largely manufactured from the shales of Lancashire, Yorkshire, and Lanarkshire. There are sandy, calcareous, purely argillaceous, and carbonaceous shales.

Shale (shāl), *v.t.* To peel.

Life in its upper grades was bursting its shell, or was *shaling* off its husk. *Is. Taylor.*

Shall (shal), originally *v.t.*, now only *auxiliary*. Pres. I *shall*, thou *shalt*, he *shall*, pl. I, 2, and 3 *shall*; imperf. *shouldst* or *shouldst*, *should*, pl. *should*. [Formerly *schal*, *shat*, *shut*, pret. *shold*, *shulde*; A.Sax. *scat*, *seal*, I *shall*, I have to, I ought; pl. *sculon*, pret. *secolde*, *seolde*, inf. *sculan*. This is a preterite present, that is a preterite which has been transformed into a present, having then acquired a new preterite of its own.

Similar forms occur throughout the Teutonic tongues, all regarded as from a verb signifying to kill; so that *shall* originally meant I have killed; hence, I have become liable for the verid, then I owe, I ought, I shall.] I. As independent verb: (a) to owe; to be under obligation for. 'By that faith I *shal* to God.' *Chaucer.* (b) Have to; be called upon; be obliged; must. [In this sense almost the auxiliary.]

First tell me whither I *shal* go and to what man *Chaucer.*
Al dreery was his chere and his looking
When that he *shold* out of the chambray go. *Chaucer.*

2. As an auxiliary: (a) to express mere futurity, forming the first persons singular and plural of the future tense (including the future perfect), and simply foretelling or declaring what is to take place—am to, are to; as, I or we *shall* ride to town on Monday. This declaration simply informs another of a fact that is to take place. Of course there may be an intention or determination in the mind of the speaker, but *shall* does not express this in the first person, though *will* does, I *will* go, being equivalent to I am determined to go, I have made up my mind to go. Hence, I *will* be obliged, or we *will* be forced, to go is quite wrong. The rest of the simple future is formed by the auxiliary *will*; that is to say, the future in full is, I *shall*, thou *wilt*, he *will*, we *shall*, you *will*, they *will*. In indirect narrative, however, *shall* may express mere futurity in the second and third persons in such sentences as, he says or thinks he *shall* go. (b) In the second and third persons *shall* implies (1) control or authority on the part of the speaker, and is used to express a promise, command, or determination; as, you *shall* receive your wages; he *shall* receive his wages; these phrases having the force of a promise in the person uttering them; thou *shalt* not kill; he may refuse to go, but for all that he *shall* go. (2) or it implies necessity or inevitability, futurity though certain and answered for by the speaker.

Sorrow on love hereafter *shall* attend. *Shak.*
He that escapes me without some broken limb
shall acquit him well. *Shak.*

(c) Interrogatively, *shall* I go? *shall* we go? *shall* he go? *shall* they go? ask for direction or refer the matter to the determination of the person asked. But *shall* you go? asks rather for information merely as to the future without referring to another's intention. (d) After conditionals, as *if* or *whether*, and in dependent clauses generally, *shall*, in all the persons, expresses simple futurity; as,

(I *shall* say, or we *shall* say,
If thou *shalt* say, ye or you *shall* say,
He *shall* say, they *shall* say.

Whoever (—if any one) therefore *shall* break one of these least commandments, and *shall* teach men so, he *shall* be called the least, &c. Mat. v. 19.

(e) *Should*, though in form the past of *shall*, is not used to express simple past futurity; thus, I *shall* go, means I am to go, but we do not say I *should* go yesterday, for I was to go or to have gone yesterday. In the indirect speech, however, it is so used; as, I said I *should* go; I arranged that he *should* go.

The Parliament resolved that all pictures . . . *should* be burned. *Macaulay.*

Should is very commonly used (1) to express present duty or obligation, as, I, we, they *should* (now and always) practise virtue; or to express past duty or obligation; as,

I *should* have paid the bill on de-
Thou *shouldst* mand; it was my duty, your
He *should* duty, his duty to pay the bill
You *should* on demand, but it was not
paid.

(2) To express a merely hypothetical case or a contingent future event, standing in the same relation to *would* that *shall* does to *will*; thus, as we say I *shall* be glad if you will come, so we say I *should* be glad if you would come. In such phrases as, if it *should* rain to-morrow, if you *should* go to London next week, if he *should* arrive within a month, it is to be regarded as the future subjunctive. In like manner *should* is used after *though*, *grant*, *admit*, *allow*, &c. (3) It is often used in a modest way to soften a statement; thus, 'I *should* not like to say how many there are,' is much the same as 'I hardly like, I do not like; so I *should* not care if I were at home'—I do not. Similarly, 'It *should* seem' often is nearly the same as

'it seems'—but this expression is now less common than 'it would seem.'

He is no sutor then? So it *should* seem. *B. Jonson.*

Shall and *will* are often confounded by inaccurate speakers or writers, and even writers such as Addison sometimes make a slip. In quoting the following lines from a song in Sir George Etherege's 'She Would if she Could' (1704), Mr. R. Grant White says, 'I do not know in English literature another passage in which the distinction between *shall* and *will* and *would* and *should* is at once so elegantly, so variously, so precisely, and so compactly illustrated.'

How long I *shall* love him I can no more tell,
Than, had I a fever, when I *should* be well.
My passion *shall* kill me before I *will* show it,
And yet I *would* give all the world he did know it;
But oh how I sigh, when I think *should* he woo me,
I cannot refuse what I know *would* undo me.

It has been referred to Bohem. *skopec*, a wether, lit. a castrated sheep, and Diez recognizes a like connection between Fr. *mouton* and L. *mutulus*, mutilated. The common word for mutton in Italy is *castrato*.] 1. A ruminant animal of the genus *Ovis*, family Capridæ, nearly allied to the goat, and which is among the most useful species of animals to man, as its wool constitutes a principal material of warm clothing, and its flesh is a great article of food. The skin is made into leather, which is used for various purposes. The entrails, properly prepared and twisted, serve for strings for various musical instruments. The milk is thicker than that of cows, and consequently yields a greater relative quantity of butter and cheese. The sheep is remarkable for its harmless temper and its timidity. The varieties of the domestic sheep (*Ovis aries*) are numerous, but it is not certainly known from what wild species these were originally derived. Some at any rate of the domesticated breeds, more especially the smaller short-tailed breeds, with crescent-shaped horns, appear to be descended from the wild species known as the *Mouflon* (which see). The principal varieties of the English sheep are the large Leicester, the Cotswold, the South-down, the Cheviot, and the black-faced breeds. The Leicester comes early to maturity, attains a great size, has a fine full form, and carries more mutton, though not of finest quality, in the same apparent dimensions, than any other; wool not so long as in some, but considerably finer—weight of fleece 7 to 8 lbs. The Cotswolds have been improved by crossing with Leicesters. Their wool is fine, and mutton fine-grained and full-sized. South-downs have wool short, close, and curled; and their mutton is highly valued for its flavour. They attain a great size, the quarter often weighing 25 to 30 lbs., and sometimes reaching to 40 or 50. All the preceding require a good climate and rich pasture. The Cheviot is much harder than any of the preceding, and is well adapted for the green, grassy hills of Highland districts.

est of all, and adapted for wild heathery hills and moors. Its wool is long but coarse, but its mutton is the very finest. The Welsh resembles the black-faced, but is less. 1. In England, the chief officer of the crown in every county or shire, who does all the sovereign's business in the county, the crown by letters-patent committing the custody of the county to him alone. Sheriffs are appointed by the crown upon presentation of the judges in a manner partly regulated by law and partly by custom (see *PRICKING*); the citizens of London, however, have the right of electing the sheriffs for the city of London and the county of Middlesex. Those appointed are bound under a penalty to serve the office, except in specified cases of exemption or disability. As keeper of the queen's peace the sheriff is the first man in the county, and superior in rank to any nobleman therein during his office, which he holds for a year. He is specially intrusted with the execution of the laws and the preservation of the peace, and for this purpose he has at his disposal the whole civil force of the county—in old legal phraseology, the *posse comitatus*. The most ordinary of his functions, which he universally executes by a deputy called *under-sheriff*, consists in the execution of writs. The sheriff only performs in person such duties as are either purely honorary—for instance, attendance upon the judges on circuit—or as are of some dignity and public importance, such as the presiding over elections and the holding of county meetings, which he may call at any time.—2. In Scotland, the chief local judge of a county. There are two grades of sheriffs, the chief or superior sheriffs and the sheriffs-substitute (besides the lord-lieutenant of the county, who has the honorary title of sheriff-principal), both being appointed by the crown. The chief sheriff, usually called simply the sheriff, may have more than one substitute under him, and the discharge of the greater part of the duties of the office now practically rests with the sheriffs-substitute, the sheriff being (except in one or two cases) a practising advocate in Edinburgh, while the sheriff-substitute is prohibited from taking other employment, and must reside within his county. The civil jurisdiction of the sheriff extends to all personal actions on contract, bond, or obligation without limit, actions

for rent, possessory actions, &c., in which cases there is an appeal from the decision of the sheriff-substitute to the sheriff, and from him to the Court of Session. He has also a summary jurisdiction in small debt cases, where the value is not more than £12. Some derive it from root signifying to dig or hollow out, whence *L. scapha*, *Gr. skaphê*, a bowl, a boat, a skiff; *Gr. skaptô*, to dig.] 1. A vessel of some size adapted to navigation; a general term for vessels of whatever kind, excepting boats. Ships are of various sizes and fitted for various uses, and receive various names, according to their rig and the purposes to which they are applied, as man-of-war ships, transports, merchantmen, barques, brigs, schooners, luggers, sloops, xebecs, galleys, &c. The name, as descriptive of a particular rig, and as roughly implying a certain size, has been used to designate a vessel furnished with a bowsprit and three masts—a main-mast, a fore-mast, and a mizen-mast—each of which is composed of a lower-mast, a top-mast, and a top-gallant mast, and carries a certain number of square sails. The square sails on the mizen distinguishes a ship from a barque, a barque having only fore-and-aft sails on the mizen. But the development of steam navigation, in which the largest vessels have sometimes only a schooner rig and sometimes four masts, has gone far towards rendering this restricted application of the term ship of little value. Owing to increase of size, and especially increase in length, some sailing vessels now have four masts, and this rig is said to have certain advantages. Up to within recent times wood, such as oak, pine, &c., was the material of which all ships were constructed, but at the present day it is being rapidly superseded by iron and steel; and in Britain, which is the chief ship-building country in the world, the tonnage of the wooden vessels constructed is but a fraction of that of those built of iron. The first iron vessel classed at Lloyd's was built at Liverpool in 1838, but iron barges and small vessels had been constructed long before this.—*Armed ship*. See under ARMED.—*Ship's papers*, the papers or documents required for the manifestation of the property of the ship and cargo. They are of two sorts, viz. (1) those required by the law of a particular country, as the certificate of registry, license, charter-party, bills of lading, bills of health, &c., required by the law of England to be on board British ships. (2) Those required by the law of nations to be on board neutral ships to vindicate their title to that character.—*Ship of the line*, a man-of-war large enough and of sufficient force to take its place in a line of battle.—*Ship of the desert*, a sort of poetical name for the camel.—*Registry of ships*. Shrike (shrik), *n.* [From its harsh, shrieking cry.] A general name applied to the members of a family (Laniidae) of insectorial birds belonging to the dentirostral division of the order. The family is conveniently divided into two groups, the Laniine, or true shrikes, and the *Thamnophilinae*, or bush-shrikes. The genus *Lanius* is distinguished by the broad base of the bill, which

Great Gray Shrike (*Lanius excubitor*)

is hooked at the tip. The nostrils, which are situated laterally, are surrounded by bristles. The fourth quill is longest in the wings, and the tail is of graduated or conical shape. The great gray shrike (*L. excubitor*) makes its appearance in Britain during the winter. This species is coloured gray on the upper and white on the under parts; the quills of the tail being black with white tips, whilst a band of black crosses the forehead, surrounds the eyes, and terminates at the ear covers. The average length is about 9 or 10 inches. The food consists of mice, shrew-mice, small birds, frogs, and insects; and these birds have the habit of impaling their prey on thorns or suspending it on the branches of trees, in order to tear it to pieces with greater ease, a habit which has obtained for them the name of butcher-birds. The red-backed shrike (*Lanius* or *Emneotus colurio*), a summer visitant to Britain, is our most common species. Its

Forked-tail Crested Shrike (*Dicurus cristatus*)

average length is 6 or 7 inches. A popular name for it (and also for other species) is the nine-killer, from a belief that it impales

nine creatures together before beginning to eat them. The woodchat shrike (*L. or E. rufus*) sometimes appears in Britain. In the *Thamnophilinae*, or tree-shrikes, the bill is long and possesses an arched keel, the tip being hooked and bristles existing at the base. Some of the species attain a length of from 12 to 13 inches. They are common in South America. The name of drongos or drongo-shrikes has been given to certain birds allied to the shrikes, and forming the family *Dicrurinae* (which see). The forked-tail crested shrike, a bird inhabiting India, about 10 inches in length, is an example of these.

11. In *astron.* a portion of the ecliptic or zodiac containing 30 degrees, or a twelfth part of the complete circle. The signs are reckoned from the point of intersection of the ecliptic and equator at the vernal equinox, and are counted onwards, proceeding from west to east, according to the annual course of the sun, all round the ecliptic. In printing they are represented by the following marks, which are attached to their respective names:—Aries ♈, Taurus ♉, Gemini ♊, Cancer ♋, Leo ♌, Virgo ♍, Libra ♎, Scorpio ♏, Sagittarius ♐, Capricorn ♑, Aquarius ♒, Pisces ♓. The first six signs, commencing with Aries, are called *northern signs*, because they lie on

the north side of the equator; and the other six, commencing with Libra, are called *southern signs*, because they lie on the south side of the equator. The six beginning with Capricornus are called *ascending signs*, because the sun passes through them while advancing from the winter to the summer solstice, and is consequently acquiring altitude with respect to inhabitants of the northern hemisphere. The other six, beginning with Cancer, are called *descending signs*, because the sun in passing through them diminishes his altitude with respect to inhabitants of the northern hemisphere. These names are borrowed from the constellations of the zodiac of the same denomination, which were respectively comprehended within the foregoing equal divisions of the ecliptic at the time when those divisions were first made; but on account of the precession of the equinoxes the positions of these constellations in the heavens no longer correspond with the divisions of the ecliptic of the same name, but are considerably in advance of them. Thus the constellation Aries is now in that part of the ecliptic called Taurus.—12. Silica (sil'i-ka), *n.* [L. *silix*, *silicis*, a flint.] (SiO_2) Oxide of silicon. This important substance constitutes the characteristic ingredient of a great variety of minerals, among which rock-crystal, quartz, chalcedony, and flint may be considered as nearly pure silica. It also predominates in many of the rocky masses which constitute the crust of our globe, such as granite, the varieties of sandstone, and quartz rock. It is the chief substance of which glass is made; also an ingredient, in a pulverized state, in the manufacture of stoneware, and it is essential in the preparation of tenacious mortar. Silica, when pure, is a fine powder, hard, insipid, and

inodorous, rough to the touch, and scratches and wears away glass. It combines in definite proportions with many salifiable bases, and its various compounds are termed silicates. Plate-glass and window-glass, or, as it is commonly called, crown-glass, are silicates of sodium or potassium, and flint-glass is a similar compound, with a large addition of silicate of lead. See **SILICIC**.

Silk is the strongest, most lustrous, and most valuable of textile fabrics, and is a thread composed of several finer threads which the worm draws from two large organs or glands, containing a viscid substance, which extend along great part of the body, and terminate in two spinnerets at the mouth. With this substance the silkworm envelops itself, forming what is called a *cocoon*. *Raw silk* is produced by the operation of winding off, at the same time, several of the balls or cocoons (which are immersed in hot water to soften the natural gum on the filament) on a common reel, thereby forming one smooth even thread. Before it is fit for weaving it is converted into one of three forms, viz. *singles*, *tram*, or *organzine*. *Singles* (a collective noun) is formed of one of the reeled threads, being twisted in order to give it strength and firmness. *Tram* is formed of two or more threads twisted together. In this state it is commonly used in weaving, as the *shoot* or *weft*. *Thrown silk* is formed of one, two, three, or more singles, according to the substance required, twisted together in a contrary direction to that in which the singles of which it is composed are twisted. The silk so twisted is called *organzine*. *Spun silk* is waste silk, pierced cocoons, floss, &c., dressed, combed, formed into rovings, and spun by processes and on machinery analogous to that used in the worsted manufacture.—*Tussah silk*, a term applied to the raw silk produced by a variety of moths other than the ordinary silkworm, *Bombyx mori*.—2. Silver (sil'vēr), *n.* [*A. Sax. seolfer, sylfer, Icel. silfr, D. silber, Dan. sølv, G. silber, Goth. silubr; cog. Rus. srebro, serebro, Lith. sidabras, Lett. sudrabs*—silver. Root doubt-ful.] Syn. Ag. At. wt. 108. 1. A metal which in its compact state is of a fine white colour and lively brilliancy. It possesses

the metallic lustre in a remarkable degree, is capable of being highly polished, and has neither taste nor smell. Its sp. gr. is about 10.53. A cubic foot weighs about 660 lbs. Its ductility is little inferior to that of gold. It is harder and more elastic than tin or gold, but less so than copper, platinum, or iron. It is superior to gold in lustre, but inferior to it in malleability; it is, however, so malleable that it may be beaten into leaves not exceeding the 100,000th part of an inch in thickness. It is not altered by air or moisture, but is blackened or tarnished by sulphuretted hydrogen. The numerous uses and applications of silver are well known. In its pure state it is too soft for coin, plate, and most ornamental purposes, and is therefore in such cases alloyed with copper, by which, in proper proportion, its colour is not materially impaired, and it is considerably hardened. The standard silver of our coin is an alloy 222 parts of pure silver, and 18 of copper. Native silver occurs abundantly, and is generally alloyed with gold, platinum, copper, iron, arsenic, cobalt, &c., most frequently with platinum. The ores of silver are numerous, and indeed there are few metallic ores which do not contain some traces of it. —*Simile, Metaphor, Allegory, Parable*, agree in implying likeness between a primary object, or the thing likened, and a secondary, or that to which it is likened. *Simile* asserts mere resemblance, and states what is literally true; as, man is like grass. *Metaphor* asserts what, taken literally, is not true, affirming the primary to be the secondary; as, all flesh is grass. *Allegory* has been defined to be a continued metaphor, but improperly. *Metaphor* presents always both objects; *allegory*, the secondary only, so that its real meaning and application are only to be perceived by inference. The most characteristic feature of *allegory* is the personification of abstract ideas and things without life, and the *allegory* generally forms an independent whole of some length. *Spenser's Faery Queen* and *Imbryan's Pilgrim's Progress* are the most perfect examples in modern literature. *Parable* is usually devoted to the inculcation of some truth or principle by means of an invented case or incident resembling or parallel to a real case, the author of the parable being thus enabled to put prominently and forcibly forward the essential points intended to be emphasized.

Siphon, Syphon (sɪ'fɔn), *n.* [Gr. *siphōn*, a hollow tube, a reed.] 1. A bent pipe or tube whose legs are of unequal length, used for drawing liquid out of a vessel by causing it to rise in the tube over the rim or top. For this purpose the shorter leg is inserted in the liquid, and the air is exhausted by being drawn through the longer leg. (See fig. 1.) The liquid then rises by the weight of the atmosphere till it reaches the top of the vessel, and then descends in the lower leg till the liquid in the vessel reaches the level of the end of the shorter leg. The action of the siphon depends on the difference between the lengths of the two legs, estimated in a perpendicular direction, the shorter leg being always inserted in the liquid. Sometimes an exhausting tube is placed on the longer leg for exhausting the air by suction (see fig. 2), and causing the flow to commence, but the more general method is to fill the tube in the first place with the liquid, and then stopping the mouth of the longer leg to insert the shorter leg in the vessel; upon removing the stop the liquid will immediately begin to flow. The limits within which the siphon can act are determined by the specific gravity of the fluid. Water cannot be raised by the siphon to a

greater height than 32 feet, nor mercury to a greater height than 29 inches.—*Wärtemberg siphon* (so called from its having been first used in that place), a siphon with both legs equal, and turned up at the extremities, in which case so long as the extremities are kept on the same level, it will continue always full and ready for use.—2. There are several varieties of siphon-barometers, but the most convenient is that invented by Gay-Lussac. The tube is hermetically sealed at both ends, after having been filled with mercury, and the communication with the atmosphere takes place through a small capillary hole drilled laterally through the short turned-up branch near its upper extremity. This orifice is so small that while it allows the air to pass freely, it prevents the escape of the mercury. This barometer is very convenient for carriage, and is easily brought to a position proper for observation.

Siphon-bottle (sɪ'fɔn-bot'l), *n.* A bottle for containing aerated waters which may be discharged through a bent tube by the pressure of the gas.

Thus in *The Rivals*, by Sheridan, Sir Ant. Absolute addresses his son, 'What's that to you, *sir*?' 'Odds life, *sir*! if you have the estate you must take it with the live stock on it; and so on.—2. A title of honour of knights and baronets; in this case always prefixed to the Christian name. So that a bachelor, who in the books stood *Dominus* Brown, was in conversation called *Sir* Brown. . . . Therefore, as most clerical persons had taken that first degree, it became usual to style them *Sir*. *Nares.*

So usual indeed did the practice alluded to

by Nares become that a 'Sir John' came to be a common sobriquet for a priest.

Instead of a faithful and painful teacher, they hire a *Sir* John, which hath better skill in playing at tables . . . than in God's word. *Latimer.*

4. Used also as a common noun to signify (a) lord, master. 'Sole *sir* o' the world.' *Shak.* (b) Gentleman. 'A nobler *sir* ne'er lived.' *Shak.*

An instrument for producing continuous or musical sounds, and for measuring the number of sound waves or vibrations per second, which produce a note of given pitch. In its original form it consists of a disc with a circular row of oblique holes, revolving close to the top-plate of a wind-chest perforated with corresponding holes of a contrary obliquity, so that the jets of air from the latter passing through the former keep the disc in motion, and produce a note corresponding to the rapidity of the coincidences of the holes in the two plates, the number of coincidences or vibrations to a given time being shown by indices which connect by toothed wheels with a screw on the axis of the disc. From the deep piercing nature of the sound which the siren emits, a modified form of the instrument having two discs rotating with great velocity in opposite directions is employed as a fog-signal or alarm. The discs are driven by a steam-engine, which also forces a blast of steam through their apertures when those of the two discs come in opposition. The device is placed at the smaller extremity of a large trumpet, which greatly intensifies the sound. Called also *Sirene*.

This order comprises the manatee and dugong. They differ from the Cetacea in having the nostrils placed at the anterior part of the head, and in having molar teeth with flat crowns adapted for a vegetable diet. They feed chiefly on seaweeds, and frequent the mouths of rivers and estuaries. Besides these living members the Sirenia were represented by a gigantic species 25 feet long and 20 in circumference. It was a native of Behring's Straits, but is now extinct, no specimen having been seen for 200 years. The Sirenia have existed since the miocene period.

Sleep (slĕp), *n.* [A. Sax. *slēp*, O. Fris. *slēp*, Goth. *slēps*, G. *schlaf*. See the verb.] 1. A natural and healthy, but temporary and periodical suspension of the functions of the organs of the senses, as well as of volition; that state of the animal in which the senses are more or less unaffected by external objects, and the fancy or imagination only is active. During sleep the operations of the senses are entirely suspended as regards the effects of ordinary impressions, but the purely animal functions continue in action; the heart beats and the lungs respire with greater regularity, but less vigour; the stomach, the intestines, and their accessory organs digest; the skin exhales vapour, and the kidneys excrete urine. With the central nervous system, however, the case is very different; for while some parts may retain the power of receiving impressions or developing ideas, others have their actions diminished, exalted, perverted, or altogether arrested. It is on the nutritive regeneration of the tissues (more especially of the nervous tissue) which takes place during true healthy sleep

that its refreshing power and value to the organism depends. The quantity of sleep required by different individuals is various, from six to nine hours being the average proportion; but persons of very active dispositions and abstinence habits will be satisfied with much less, while children and aged people require much more. The physiological causes of sleep are as yet undetermined. Sometimes used in the plural.

That in their sleeps will mutter their affairs. *Shak.*

2. Death; rest in the grave.

No noise, but silence and eternal sleep. *Shak.*

—*Sleep of plants*, a state of plants at night when their flowers close, the leaves change their positions, and fold themselves together, while vitality seems to retire from the periphery. This is chiefly owing to the withdrawal of the stimulus of light to which they are subjected during the day. The name is also given to a similar phenomenon occurring during the day. See extract.

There is another class of movements, dependent on the action of light. We refer to the movements of leaves and cotyledons which when moderately illuminated are diachlotropic, but which change their positions and present their edges to the light, when the sun shines brightly on them. These movements have sometimes been called diurnal sleep.

Darwin.

especially when young; and *Bradypus* or *Choloepus didactylus* or man, a native of the West Indies, about half the size of the former. They live on trees, and never remove from the one they are on until they have stripped it of every leaf. Smell (smel), *n.* 1. The sense or faculty by which certain qualities of bodies are perceived through the instrumentality of the olfactory nerves; the faculty of perceiving by the nose; one of the five senses. The essential part of the organ of smell consists of the expansion of the olfactory nerves, the first or most anterior pair of the nerves issuing from the brain, whose minutest branches are distributed just beneath the mucous membrane of the nose. The air, passing through the nose, brings the effluvia or odoriferous particles of bodies into contact with the olfactory nerves, the nerves transmit the impression to the brain, by means of which it is perceived by the mind. The human organ of smell is less developed than that of some other mammalia, or even of birds. In different animals the sense of smell is adapted chiefly to that class of substances on which they feed. In the choice of food, which is the main object of the sense of smell, man generally, though almost unconsciously, and animals always, exercise the precaution of smelling, and they instinctively form a judgment according to the impression received. In eating also, much of that which is commonly attributed to the sense of taste depends upon the odour of the food carried from the mouth to the nose.—2. The quality of any thing or substance, or emanation therefrom, which affects the olfactory organs; odour; scent; perfume; as, the *smell* of mint; the *smell* of geranium. This operation requires to be conducted differently according to the different metallic ores. In regard to iron, the ore, after having been roasted or calcined in a kiln, in order to drive off the water, sulphur, and arsenic with which it is more or less combined in its native state, is subjected to the heat of a blast-furnace, along with certain proportions of coke and limestone, which latter serves as a flux. (See BLAST-FURNACE.) Copper is reduced at once from its oxides in shaft-furnaces (furnaces resembling blast-furnaces); but the sulphurets must first be roasted, then smelted for matte by reducing in shaft or reverberatory furnaces, again roasted, and again smelted, and so on until a matte is produced rich and pure enough to give raw copper after another roasting and final reducing smelting. Lead is smelted directly from very pure galena in one operation by a blast on the blast-hearth. It is also sometimes roasted in a reverberatory furnace and reduced in a shaft furnace.

The methods employed for the latter purpose all merge into one common principle; namely, that of mixing air with the combustible vapours and gases generated by the action of heat on piteal, so that they may be made to burn with flame, and become entirely converted into incombustible and transparent invisible vapours and gases.

formed in the air when the temperature of the atmosphere sinks below the freezing-point. The particles of moisture contained in the atmosphere are then frozen, and form flakes, which descend to the earth. Each

flake which falls is composed of a number of minute crystals of ice, which present countless modifications of the hexagonal system. They have great diversities of density, and display innumerable varieties of the most beautiful forms. These crystals adhere together to form an irregular cluster; and consequently the incident rays of light, which are refracted and reflected so as to present individually the prismatic colours, are scattered after reflection in all directions, and combine to give to the eye the colour sensation of *white*. When sufficient pressure is applied the slightly adhering crystals are brought into true molecular contact, when the snow, losing its white colour, assumes the form of ice. Snow answers many valuable purposes in the economy of nature. Accumulated upon high regions it serves to feed, by its gradual melting, streams of running water, which a sudden increase of water, in the form of rain, would convert into destructive torrents or standing pools; and in many countries it tempers the burning heats of summer by cooling the breezes which pass over it. In severer climates it serves as a defence against the rigours of winter by protecting vegetation from the frost, and by affording a shelter to animals which bury themselves under it. Even in more temperate climates it is found that vegetation suffers more from an open winter than when the fields, during that season, lie hid beneath a snowy covering; for as snow is a slow conductor of heat a coating of it prevents the earth from parting quickly with its warmth, and at the same time protects it from the cold of the atmosphere. — *Red snow*. See PROTOCOCCUS. 2. Something that resembles snow, as white blossoms. 'The scent of the elder bushes which were spreading their summer snow close to the open window opposite.' *George Eliot*. — *Snow* is often used in the formation of compounds, many of which are self-explanatory, as *snow-capped*, *snow-crowned*, *snow-mantled*, and the like.

Snow (snō), *n*. It sings very sweetly, sitting on the ground; and does not perch, but runs about like the lark. It is about 7 inches in length; the back and part of the wings are dark black-brown, and the whole of the remaining feathers are pure snowy white. This limit is called the snow-line, or line of perpetual congelation, and the mountains which rise above it are always covered with snow. The snow-line varies according to latitude, being highest near the equator and lowest near

The angular point or edge is made to enter the snow, and the machine being propelled by horses harnessed to the centre framework, the snow is thrown off by the boards to the sides of the road, and thus a free passage is opened up for wheel-carriages, &c. For railway purposes snow-ploughs are of various forms, adapted to the character of the country, the amount of snowfall, the tendency to drift, &c.

Some varieties, as the rappes, are moist. The admixture of different flavouring agents and delicate scents has given rise to fanciful names for snuffs, which, the flavour excepted, are identical. Sax. *säpe*, Sw. *säpa*, L.G. *sepe*, O.H.G. *seifa*, from same root as *L. sebum*, tallow; *L. sapo*, soap, appears to have been borrowed from the old German.] 1. A chemical compound of common domestic use for washing and cleansing, and also used in medicine, &c. It is a compound resulting from the combination of certain constituents derived from fats, oils, grease of various kinds both animal and vegetable, with certain salifiable bases, which in household soaps are potash and

soda. Chemically speaking soap may be defined as a salt, more especially one of the alkaline salts of those acids which are present in the common fats and oils, and soluble soaps may be regarded as oleates, stearates, and margarates of sodium and potassium. There are many different kinds of soaps, but those commonly employed may be divided into three classes:—1. Fine white soaps, scented soaps, &c.; 2. Coarse household soaps; 3. Soft soaps. White soaps are generally combinations of olive-oil and carbonate of soda. Perfumes are occasionally added, or various colouring matters stirred in while the soap is semifluid. Common household soaps are made chiefly of soda and tallow. Yellow soap is composed of tallow, resin, and soda, to which some palm-oil is occasionally added. Mottled soap is made by simply adding mineral and other colours during the manufacture of ordinary hard soap. Marine soap, which has the property of dissolving as well in salt-water as in fresh, is made of cocoa-nut oil, soda, and water. Soft soaps are generally made with potash instead of soda, and whale, seal, or olive oil, or the oils of linseed, hempseed, rape-seed, &c., with the addition of a little tallow. Excellent soaps are made from palm-oil and soda. Soap is soluble in pure water and in alcohol; the latter solution jellies when concentrated, and is known in medicine under the name of *opodeldoc*, and when evaporated to dryness it forms what is called transparent soap. Medicinal soap, when pure, is prepared from caustic soda, and either olive or almond oil. It is chiefly employed to form pills of a gently aperient antacidation. —2. Flattery. [Slang.]

Soap (sôp), *v. t.* [From the noun.] 1. To rub or wash over with soap. —2. To flatter. [Slang.]

Soda (sô'da), *n.* [Sp. Pg. and It. *soda*, *zasswort*, barilla, from Ar. *sued*, *soda*.] (Na_2O) The protoxide of the metal sodium, formerly called mineral alkali. It has likewise been called a fixed alkali, in contradistinction from ammonia, which is a volatile alkali. Soda, or protoxide of sodium, is formed when sodium is burned in dry air or oxygen. It is a white powder, which attracts moisture and carbonic acid from the air. When this

protoxide is dissolved in water, there is formed the true alkali or hydrate of sodium, called also caustic alkali, NaHO , which is a white brittle mass of a fibrous texture, having a specific gravity of 1.536. Caustic soda has a most corrosive taste and action upon animal substances: it dissolves readily both in water and alcohol, in the solid form it readily attracts carbonic acid from the atmosphere, falling thereby into an efflorescent carbonate. It forms soaps with tallow, oils, wax, rosin; dissolves wool, hair, silk, horo, alumina, silica, sulphur, and some metallic sulphides. With acids soda forms salts which are soluble in water, and many of which crystallize. The carbonate of soda, $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$, is the soda of commerce in various states, either crystallized, in lumps, or in a crude powder called soda-ash. The manufacture of carbonate of soda is divided into three branches. The first process is the decomposition of sea-salt or common salt (chloride of sodium) by means of sulphuric acid; the second, the conversion of the sulphide of sodium so produced into crude carbonate of soda by strongly heating with chalk and carbonaceous matter; and third, the purification of this crude carbonate, either into a dry white soda-ash or into crystals. The chief uses of soda are in the manufacture of glass and of hard soap. The carbonate of soda is used in washing, and is a powerful detergent, although milder than carbonate of potash. It is also used in medicine. Sulphate of soda is glauber-salts. See **SODIUM**.

Sodium (sô'di-um), *n.* [See SODA.] Sym. Na. (from *Natrium*). At. wt. 23. The metal of which soda is the oxide, discovered by Davy in 1807. He obtained it by a process exactly similar to that by which he procured potassium, which it strongly resembles in many properties. Gay-Lussac and Thénard soon afterwards procured it in greater quantity by decomposing soda by means of iron; and Brunner showed that it may be prepared with much greater facility by distilling a mixture of sodic carbonate with charcoal: it is now prepared by the latter process in considerable quantities. Sodium is a silver-white metal, having a very high lustre. Its sp. gr. is 0.972; it melts at 194° Fahr., and oxidizes rapidly in the air, though not so rapidly as potassium. It decomposes water instantly, but does not spontaneously take fire when thrown on water, unless the water be somewhat warm, or the progress of the globe of sodium upon the surface of the water be impeded. When heated in air or oxygen it takes fire and burns with a very pure and intense yellow flame. It is perhaps more abundant in our globe than any other metal, for it constitutes two-fifths of all the sea-salt existing in sea-water, in the water of springs, rivers, and lakes, in almost all soils, and in the form of rock-salt. Sea-salt is a compound of chlorine with sodium. Sodium also occurs as oxide of sodium or soda in a good many minerals; and more especially in the form of carbonate, nitrate, and borate of soda. Soda is contained in sea plants, and in land plants growing near the sea. It occurs also in most animal fluids. The only important oxide of sodium is the protoxide known as soda. See SODA.

A product described by Strabo, Tacitus, and Josephus, as a fruit found on the shores of the Dead Sea, beautiful to the sight, but turning to bitter ashes when eaten, in reality a gall produced on dwarf-oaks by the puncture of a species of gall-insect. The Sodom-apple or apple of Sodom is employed as a rhetorical figure to represent what excites high hopes or expectations, but ultimately produces only bitter disappointment.

Soil (soil), *n.* [O.Fr. *soil*, *soile*, Mod. Fr. *sol*, from *L. solum*, the soil, generally taken from the root of *solidus*, solid.] 1. The upper stratum of the earth: the mould, or that compound substance which furnishes nutriment to plants, or which is particularly adapted to support and nourish them; earth; ground. Wherever the surface of the earth is not covered with water, or is not naked rock, there is a layer of earth more or less mixed with the remains of animal and vegetable substances in a state of decomposition, which is commonly called the soil. Soils may generally be distinguished from mere masses of earth by their friable nature and dark colour, and by the presence of some vegetable fibre or carbonaceous matter. In uncultivated grounds soils generally occupy only a few inches in depth on the surface; and in cultivated grounds their depth is generally the same as that to which the implements used in cultivation have penetrated. The stratum which lies immediately under the soil is called the subsoil, which is comparatively without organized matter. Soil is composed of certain mixtures or combinations of the following substances: the earths, silica, alumina, lime, magnesia; the alkalis, potassa, soda, and ammonia, oxide of iron and small portions of other metallic oxides, a considerable proportion of moisture, and several gases, as oxygen, hydrogen, carbonic acid. Besides these every soil contains vegetable and animal matters, either partially or wholly decomposed. The analysing of soils, in order to ascertain their component parts and qualities, and their adaptation to the growth of various vegetable productions, as well as the methods of improving them by means of chemical manures, form the subject of agricultural chemistry.—2. See *SPECTRUM*.—*Solar spots*, dark spots that appear on the sun's disc, usually visible only by the telescope, but sometimes so large as to be seen by the naked eye. They indicate the sun's revolutions on its axis, are very changeable in their figure and dimensions, and vary in size from mere points to spaces of 50,000 miles or more in diameter. The frequency of solar spots attains a maximum every ten-and-a-half years, falling off during the interval to a minimum, from which it recovers gradually to the next maximum. This periodicity has been thought to be intimately connected with meteorological phenomena.—*Solar system*, in astron. that system of which the sun is the centre. To this system belong the planets, planetoids, satellites, comets, and meteorites, which all directly or indirectly revolve round the central sun, the whole being bound together by the mutual attractions of the several parts. According to the *Ptolemaic system*, framed by the

Greek astronomer Ptolemy, the earth was an absolutely fixed centre, and the heavens were considered as revolving about it from east to west, and carrying along with them all the heavenly bodies, the stars and planets, in the space of twenty-four hours. The *Copernican system*, taught by Copernicus in the beginning of the sixteenth century, represents the sun to be at rest in the centre of the universe, and the earth and the several planets as revolving about him as a centre, while the moon and the other satellites revolve about their primaries. The heavens and fixed stars were supposed to be at rest, and their apparent diurnal motions were imputed to the earth's motion from west to east. Notwithstanding the defects of this system it produced a powerful effect, and prepared the way for the discoveries of Galileo, Kepler, and Newton. The *Tychonic system*, propounded by Tycho Brahe, the Danish astronomer, in the latter part of the sixteenth century, represented that the earth was fixed in the centre of the universe, and that round it revolved the sun and moon, while the planets revolved directly round the sun. Brahe's observations were of immense service to his contemporary Kepler in discovering the famous laws which ultimately led Newton to the grand theory of universal gravitation. (See *KEPLER'S LAWS*.) The *Newtonian system*, so named as being adopted by Sir Isaac Newton, is the only one admitted in modern astronomy. It is frequently called the *Copernican system*, from its rejecting what Copernicus rejected; but it is far from receiving all that Copernicus received. In this system there is no fixed centre, the sun only approximating to that character from its greater magnitude. The orbits of the planets, which all revolve round the sun, are ellipses, of which the elements vary.—*Solar telegraph*, a telegraph in which the rays of the sun are projected from and upon mirrors. The duration of the rays makes the alphabet, after the manner of the dot-and-dash telegraphic alphabet; a heliostat (which see).—*Solar time*. The same as *Apparent Time*. See *TIME*.—*Solar year*. Soldering (solder-ing), *n.* The process of uniting the surfaces of metals, by the intervention of a more fusible metal, which being melted upon each surface, serves, partly by chemical attraction, and partly by cohesive force, to bind them together. The alloy used as a solder must not only be more fusible than the metal or metals to be united, but must also have a strong affinity for them. The solder usually contains a large proportion of the metal to which it is to be applied, in combination with some more easily fusible metal. The surfaces to be united must be made perfectly clean and free from oxide. This is commonly effected by scraping the surfaces; and in order that the formation of any oxide may be prevented during the process, borax, sal ammoniac, or rosin is used, either mixed with the solder or applied to the surfaces. — *Autogenous soldering* is the union of two pieces of metal without the intervention of any solder, by fusing them at the point of junction by jets of flame from a gas blowpipe or by other means.

An impropriety in the use of language, arising from ignorance; a gross deviation from the idiom of a language, or a gross deviation from the rules of syntax. Among modern grammarians the term is often applied to any word or expression which does not agree with the established usage of writing or speaking. As customs change, that which may be regarded as a *solecism* at one time may at another be considered as correct language. Solmization, Solimisation (sol-mî-z'â-shon), *n.* [From the syllables *sol*, *mi*.] In *music*, the art or act of giving to each of the seven notes of the scale its proper sound or relative pitch; an exercise for acquiring the true intonation of the notes of the scale, first by singing them in regular gradation upwards and downwards, and then by skips over wider intervals, an acquirement of the first importance to the learner of vocal music. To facilitate this various expedients have been devised, the most popular being the association of the several sounds with certain syllables, such as *ut*, *re*, *mi*, *fa*, *sol*, *la*, said to have been first used by Guido of Arezzo in the eleventh century—an additional syllable, *si*, for the seventh of the scale, being introduced at a much later date. These seven syllables are still used by the French, but the Italians substituted *do* for *ut*, which was objected to as wanting euphony. According to some musical systems *do*, *re*, *mi*, *fa*, *sol*, *la*, *si* are respec-

tively equivalent in absolute pitch to the notes C, D, E, F, G, A, B of the natural scale (that of C), but according to others they are used as the names of the first, second, third, &c., note of scales founded on any note, *do* being always the first, tonic, or key note. 'The supernatural *solstice* of the sun in the days of Joshua.' *Sir T. Browne*.—2. In *astron.* (a) the point in the ecliptic at the greatest distance from the equator, at which the sun appears to stop or cease to recede from the equator, either north in summer or south in winter; a tropic or tropical point. There are two *solstices*—the summer solstice, the first degree of Cancer, which the sun enters about the 21st of June; and the winter solstice, the first degree of Capricorn, which the sun enters about the 21st of December. (b) The time at which the sun is at its greatest distance from the equator, and when its diurnal motion in declination ceases, which happens at midsummer and midwinter.

The *solstitial* points, those two points in the ecliptic which are farthest from the equator, and at which the sun arrives at the time of the solstices. They are diametrically opposite to each other, and the distance of each from the equator is equal to the obliquity of the ecliptic.—*Solstitial colure*. See *COLURE*.—2. Happening at a solstice; especially, with reference to the northern hemisphere, at the summer solstice or midsummer. 'Solstitial summer's heat.' *Milton*.

to melt.] 1. Susceptible of being dissolved in a fluid; capable of solution. Sugar is *soluble* in water; salt is *soluble* only to a certain extent, that is, till the water is saturated.—2. Fig. capable of being solved or resolved, as an algebraical equation; capable of being disentangled, cleared up, unfolded, or settled by explanation, as a doubt, question, &c.

1. The act of separating the parts of any body; disruption; breach; as, a *solution* of continuity. The phrase *solution of continuity* is specifically applied in surgery to the separation of connection or connected substances or parts, as by a fracture, laceration, &c.—2. The transformation of matter from either the solid or the gaseous state to the liquid state by means of a liquid called the solvent, or sometimes the menstruum; the combination of a liquid with a liquid or a gas to form a homogeneous liquid; the state of being dissolved. When a liquid adheres to a solid with sufficient force to overcome its cohesion, the solid is said to undergo *solution*, or to become dissolved. Thus sugar or salt are brought to a state of solution by water, camphor or resin by spirit of wine, silver or lead by mercury, and so on. *Solution* is facilitated by increasing the extent of surface in a solid, or by reducing it to powder. Heat also, by diminishing cohesion, favours *solution*; but there are exceptions to this rule, as in the case of lime and its salts, water just above the freezing-point dissolving nearly twice as much lime as it does at the boiling-point. If a solid body be introduced in successive small portions into a definite quantity of a liquid capable of dissolving it, the first portions disappear most rapidly, and each succeeding portion dissolves less rapidly than its predecessor, until *solution* altogether ceases. In such cases the forces of adhesion and cohesion balance each other, and the liquid is said to be saturated. Various solids dissolve in the same liquid at very different rates; thus baric sulphate may be said to be insoluble in water; calcic sulphate requires 700 parts of water for solution; potassic sulphate, 16; magnesian sulphate, 1.5. When water is saturated with one salt it will dissolve other salts without increase of bulk. It sometimes happens that the addition of a second solid will displace the first already in solution.—3. The liquid produced as result of the process or action above described; the preparation made by dissolving a solid in a liquid; as, a *solution* of salt; a *solution* of salt, soda, or alum; *solution* of iron, &c.—*Chemical solution*, a perfect chemical union of a solid with a liquid, in accordance with the laws of definite proportions.—*Mechanical solution*, the mere union of a solid with a liquid in such a manner that its aggregate form is changed without any alteration of the chemical properties of either the solid or its solvent; thus copper dissolves in nitric acid, but only after conversion by the acid into nitrate of copper; sugar dissolves in water without undergoing any chemical change.—*Mineral solution*. See under *MINERAL*.—4. The act of solving, or the state of being solved, explained, cleared up, or removed; resolution; explanation; as, the *solution* of a difficult question in morality; the *solution* of a doubt in casuistry.

Something yet of doubt remains.
Which only thy *solution* can resolve. *Milton*.

Sonnambulism (sóm-nám'bül-izm), *n.* [*See* SONNAMBULATE.] A peculiar perversion of the mental functions during sleep, in which the subject acts automatically. The organs of sense remain torpid and the intellectual powers are blunted. During this condition some instinctive excitation may take place, and there may be the production of impulses, in consequence, of different kinds. Walking in sleep is the most palpable, but

not the most marvellous characteristic of this condition. The person affected may perform many voluntary actions implying to all appearance a certain degree of perception of the presence of external objects. The sonnambulist gets out of bed, often dresses himself, goes out of doors, and walks frequently over very dangerous places in safety. On awaking in the morning he is either utterly unconscious of having stirred during the night, or remembers it as a mere dream. Sometimes the transactions of the sonnambulist are carried much farther; he will mount his horse and ride, or go to his usual occupation. In some cases sonnambulists are capable of holding conversation. Sonnambulism occurs in the sensitive and excitable, often in conjunction with other nervous affections, and is hereditary. Artificial sonnambulism is induced in mesmerism, and the consciousness is for the time entirely absorbed by one set of ideas. *See* MESMERISM.

In the *sestette*, which is commonly made up of two tercets, the rhymes may be two or three, variously distributed. The sonnet generally consists of one principal idea, pursued through the various antitheses of the different strophes. As the professional teachers, however, unlike the philosophers named, taught for pay, and as their ranks became swelled by shallow and superficial associates, the title sophist gradually acquired a predominating bad sense, coming to mean, in the language of Aristotle, 'a pretender to knowledge, a man who employs what he knows to be fallacy, for the purpose of deceit and of getting money,' and the members of the profession were publicly condemned as men who spent their time in verbal niceties, verbal quibbles, and philosophical enigmas.—2. Sound (sound), *n.* [O. E. *soun*, *soune*, from Fr. *son*, L. *sonus*, a sound; cog. Skr. *śvan*, to sound. The *d* has been added, as in *round* (to whisper), *lend*, *hind* (a labourer).] 1. That which is heard; the effect which is produced by the vibrations of a body affecting the ear; an impression, or the effect of an impression, made on the organs of hearing by the vibrations of the air or other medium with which these organs are in contact, which vibrations are caused by the vibrations or tremulous motions of the sounding body; noise; report; as, the *sound* of a trumpet or drum; the *sound* of the human voice; a horrid *sound*; a charming *sound*; a sharp *sound*; a high *sound*; a loud *sound*; a low *sound*; an acute *sound*; a grave *sound*. No body can emit a sound unless it be put into a tremulous or vibratory motion; and hence sound, considered with respect to the sounding body, consists of a motion of vibration impressed on the parts of the body; this motion is communicated to the air which surrounds the body, and produces in it corresponding undulations, by which the ear being affected the sensation of sound is produced. The propagation of sound is not instantaneous, that is to say, the sensation is not produced at the same instant as the motion in the sonorous body which causes it; for if a gun or a piece of ordnance be discharged at a considerable

distance the flash will be first seen, and after some seconds have elapsed the report will be heard. In like manner lightning always precedes thunder, and if the thunder cloud be at a considerable distance several seconds will elapse before the thunder is heard. It has been ascertained that the velocity of sound through air at 0° Centigrade is about 1090 feet per second. The velocity is modified by such causes as the wind, and is affected by the temperature, pressure, and humidity of the air at the time. Sound is propagated or radiates from the sounding body in all directions and in straight lines, and diminishes in intensity as it recedes from the sounding body; so that at different distances from the body it is inversely as the squares of those distances. When sound is arrested in its progress by a smooth, hard, or elastic surface, as a rock, the wall of a house, of a cavern, or of a vault, it is thrown back or reflected, and thus forms what is called an *echo*, the law of the reflection being that the angle of reflection is always equal to the angle of incidence. Sounds are usually classified under the two heads of *noises* and *musical sounds*. A musical sound is caused by a regular series of exactly similar disturbances or pulses succeeding each other at precisely equal intervals of time. If these conditions are not fulfilled the sound is a noise. Musical sounds differ in *intensity*, in *pitch*, and in *quality*; *intensity* depends upon the amplitude of the vibrations; *pitch* depends upon the number of vibrations in a stated time (sound is audible, as a general rule, when the number of vibrations are more than 16 and less than 36,000 per second); the *quality* of a sound depends on the configuration or internal structure of the individual sound-waves. See *ACOUSTICS*.—2. Noise without significance; empty noise; noise and nothing else.

The husks (called in Scotland *seeds*), after being separated from the oatmeal by the sieve, still retain a considerable portion of farinaceous matter. A quantity of the husks is steeped in water till the farinaceous matter is dissolved, and until the liquid has be-

come sour. The whole is then put into a sieve, which allows the milky liquid to pass through into a barrel or other vessel, but retains the husks. The starchy matter gradually subsides to the bottom of the barrel. The sour liquor is then decanted off, and about an equal quantity of fresh water added. This mixture, when boiled, forms *sowens*. In England it is more commonly called *flummery*. Written also *Sowens*. 'These *sowens*, that is, flummery.' *Mortimer*.

The criterion is the number of cattle which each of the dominant proprietors is able to fodder during winter. A *sowm* of land is as much as will pasture one cow or ten sheep, or in some places one cow and five sheep; and, strictly speaking, to *sowm* the common is to ascertain the several *sowms* it may hold, and to *roovm* it is to portion it out amongst the dominant proprietors.

Pure *space* is capable neither of resistance nor motion. *Locke*.

Making no attempt to analyse the notion of *space*, . . . it will be sufficient for present purposes to say that we know *space* as an ability to contain bodies. I am aware that this is no definition properly so called, seeing that as the words 'contain' and 'bodies' imply ideas of *space*, the definition involves the thing to be defined. But leaving out as irrelevant all considerations of the mode in which we come by our ideas of *space*, and of bodies as occupying *space*, it will I think be admitted that the antithesis between *bodies* and an ability to contain bodies truly represents the contrast in our conceptions of the sensible non-ego (matter) and the insensible non-ego (*space*). *H. Specialization (spesh'al-iz-ā'shon), *n.* The act of specializing; the act of devoting to a particular use or function, as the setting apart of a particular organ for the performance of a particular function; special determination.

It is proved experimentally that every bundle of nerve-fibres, and every ganglion, has a special duty; and that each part of every such bundle, and every such ganglion, has a duty still more special. Can it be, then, that in the great hemispherical ganglia alone this *specialization* of duty does not hold?

Herbert Spencer.

Specialize (spesh'al-iz), *v.t. pret. & pp. specialized; ppr. specializing.* 1. To mention specially.—2. To assign a specific use or purpose to; to devote or apply to a specific use or function.

It is useless to speculate upon the use of these rude yet venerable weapons. Almost as well might we ask to what purpose could they not be applied? Numerous and *specialized* as are our modern instruments, who would care to describe the exact use of a knife?

Ed. Keo.

Specie (spesh'i), *n.* [The ablative form of *L. species*, and so used as an English word probably from its occurrence in the frequent phrase 'paid in *specie*.' See **SPECIES**.] Gold, silver, &c., coined, and used as a circulating medium of commerce; hard money; coin: in contradistinction to paper-money, as bank-notes, bills, &c.

Species (spesh'ez), *n. sing. and pl.* [L. a seeing, that which is seen, appearance, shape, a peculiar sort, kind, or quality, from *L. specio*, to look at, to behold: *Gr. skeptō, skeptomai*; *Skr. pash*, to see; akin *spite, spice, spy, dispise, respect, spectacle*, &c. Meaning *6* is derived from the fact that in *L. Latin species* (both in *sing.* and *pl.*) came from having the meaning of wares in general to have the meaning of valuables, precious goods. In French it is the plural *espèces* that is used for *specie*.] 1. Visible or sensible representation; appearance to the senses or the mind; sensible or intellectual representation; an image. [Rare.]

2. † A public spectacle or exhibition; a show.

3. A class, collection, or assemblage of things or beings classified or associated according to attributes or properties which are determined by scientific observation; as, (a) a group of animals or plants which generally bear a close resemblance to each other in the more essential features of their organization, which produce fertile progeny, and which may, in the generality of cases, produce individuals varying from the general type of the group, the variation, however, being in all cases of a limited kind. Under this definition the various species, 'kinds' of animals and plants, and their included varieties may be comprehended; and this mode of stating the idea of species at the same time leaves the great question of the 'origin of species,' raised chiefly by Darwin and his followers, an open one, and one which must be left for future observers to settle. Up till a recent time naturalists regarded species as unchanging throughout the longest succession of ages, except within narrow and marked limits. Thus Buffon defines a species as 'a constant succession of individuals similar to, and capable of reproducing each other;' and Cuvier as 'a succession of individuals which reproduces and perpetuates itself.' (b) In mineralogy, chemistry, and such sciences as relate to inorganic substances, species is regarded by some writers as being determined by identity of physical properties, as specific gravity, hardness, &c.; and by others, as constituted by chemical composition, the natural properties going for nothing. In scientific classification species unite to form groups called genera, which are included in orders, the orders forming classes, and so on.—4. In *logic*, a group of individuals agreeing in common attributes and designated by a common name; a conception subordinated to another conception, called a genus or generic conception, from which it differs in containing or comprehending more attributes, and extending to fewer individuals; thus 'man' is a *species* under 'animal' as a genus, and 'man' in its turn may be regarded as a genus with respect to European, Asiatic, and the like.—5. Kind; sort; variety; description; as, a coarse *species* of wit; a *species* of low cunning; a fine *species* of cloth; a rare *species* of generosity.—6. † Metal coined into a circulating medium; coin; specie.

Specimen (spēs'i-men), *n.* [L. *specimen*, lit. that by which a thing is seen and recognized, a mark or token, an example or specimen, from *specio*, to look, to behold. See SPECIES.] One of a class or number of similar things, as representative of the others not exhibited; a portion shown; a sample; as, a *specimen* of painting or composition; a *specimen* of one's art or skill.—*Specimen*, *Sample*. A *specimen* is a portion of a larger whole employed to exhibit the nature or kind of that of which it forms a part, without reference to the relative quality of individual portions; thus a cabinet of mineralogical *specimens* exhibits the nature of the rocks from which they are broken. A *sample* is a portion taken out of a quantity, and implies that the quality of the whole is to be judged by it, and not rarely that it is to be used as a standard for testing the goodness, genuineness, purity of the whole, and the like. In many cases, however, the words are used indifferently.

2. Anything seen; a sight. 'The dreadful *spectacle* of that sad house of pride.' *Spenser*.—3. *pl.* A well-known and invaluable optical instrument used to assist or correct some defect in the organs of vision. Spectacles consist of two oval or circular lenses mounted in a light metal frame which is made up of the 'bows,' 'bridge,' and 'sides' or 'temples.' The frame is so constructed as to adhere to the nose and temples, and keep the lenses in the proper position. Spectacles which are merely fixed on the nose are usually called eye-glasses. Spectacles with convex lenses are used to aid the sight of the aged, or those who are termed long or far sighted; and spectacles with concave lenses are used to assist the vision of those who are near-sighted. In long-sighted persons the refractive powers of the eye are too feeble, or the cornea is too much flattened; hence, the rays of light coming from an object after entering the eye do not converge sufficiently soon to be brought to a focus, and form a perfect image of the object on the retina. The convex lens counteracts this defect by increasing the convergence of the rays, and causing them to meet at the retina. Short-sightedness is a defect the very reverse of that which has been stated, and hence must be corrected by opposite means, namely, by concave lenses. In both cases the value of spectacles depends upon their being accurately adapted to the state of the eye. Spectacles with coloured lenses, as green, blue, neutral-tint, smoke-colour, &c., are used to protect the eyes from a glare of light. *Divided spectacles* have each lens composed of two semicircles of different foci neatly united; one half for looking at distant objects, and the other for examining things near the eye. Another kind, called *periscope spectacles*, has been contrived in order to allow considerable latitude of motion to the eyes without fatigue. The lenses employed in this case are either of a meniscus or concavo-convex form, the concave side being turned to the eye. Spectacles with glazed wings or frames partly filled with crape or wire-gauze are used to shield the eyes from dust, &c. Spectacles as they form an instrument of binocular power, are usually designated a *pair of spectacles*.—4.† The eye; the organ of vision.

And bad mine eyes be packing with my heart
And called them blind and dusky *spectacles*.
For losing ken of Albion's wished coast. Shak.

2. An image of something seen, continuing after the eyes are closed, covered, or turned away. If, for example, we look intensely with one eye upon any coloured object, such as a wafer placed on a sheet of white paper, and immediately afterwards turn the same eye to another part of the paper, we shall see a similar spot, but of a different colour. Thus, if the wafer be red, the seeming spot will be green; if black, it will be changed into white. These images are also termed *ocular spectra*.

3. The oblong figure or stripe formed on a wall or screen by a beam of light, as of the sun, received through a small hole or slit and refracted by being passed through a prism. This stripe is coloured throughout its length, the colours shading insensibly into one another from red at the one end, through orange, yellow, green, blue, indigo, to violet at the other. This analysis is due to the different refrangibilities of the component rays, the violet being the most refrangible and red the least. Besides the coloured rays, the spectrum contains thermal or heating rays, and chemical rays. The heating effect of the solar spectrum increases in going from the violet to the red, and still continues to increase for a certain distance beyond the visible spectrum at the red end, while the chemical action is very faint in the red, strong in the blue and violet, and sensible to a considerable distance beyond the violet end. The actinic rays, or those beyond the violet, may be rendered visible by throwing them upon a surface treated with some fluorescent substance. (See ACTINISM.) A pure spectrum of solar light is crossed at right angles by numerous dark lines, called *Fraunhofer's lines* (which see), each dark line marking the absorption of a particular elementary ray. By means of these dark lines and certain bright lines analogous to them, to be referred to, facts of the highest importance, especially in chemistry, have been ascertained. For the proper understanding of the import of these lines, five principles require to be kept in view. *First*, an incandescent solid or liquid body gives out a *continuous* spectrum. *Second*, an incandescent gaseous body gives out a *discontinuous* spectrum, consisting of bright lines. *Third*, each element when in the state of an incandescent gas gives out lines peculiar to itself. *Fourth*, if the light of an incandescent solid or liquid passes through a gaseous body, certain of its rays are absorbed, and black lines in the spectrum indicate the nature of the substance which absorbed the ray. *Fifth*, each element, when gaseous and incandescent, emits bright rays identical in colour and position on the spectrum with those which it absorbs from light transmitted through it. Now, applying these principles to the solar spectrum, we find, from the nature and position of the rays absorbed, that its light passes through hydrogen, potassium, sodium, calcium, barium, magnesium, zinc, iron, chromium, cobalt, nickel, copper, and manganese, all in a state of gas, and constituting part of the solar envelope, whence we conclude that these bodies are present in the substance of the sun itself, from which they have been volatilized by heat. The moon and planets have spectra like that of the sun, because they shine by its reflected light, while, on the other hand, each fixed star has a spectrum peculiar to itself. It has been already said that the incandescent vapour of each elementary substance has a characteristic spectrum, consisting of fixed lines, which never changes. This furnishes the chemist with a test of an exquisitely delicate nature for the detection of the presence of very minute quantities of elementary bodies. Thus, by heating any substance till it becomes gaseous and incandescent and then taking its spectrum, he is able by the lines to read off, as it were, from the spectrum the various elements present in the vapour. Four new elements, viz. rubidium, cesium, indium, and thallium, have thus been detected. The employment of the spectrum for the detection of the presence of elementary bodies, whether by observing the

rays they absorb or those they emit, is called *spectrum or spectral analysis*, and the instrument employed a *spectroscope* (which see).

A sphere is two-thirds of its circumscribing cylinder. Spheres are to one another as the cubes of their diameters. The surface of a sphere is equal to four times the area of one of its great circles, and the solidity is found by multiplying the cube of the diameter by $\frac{5236}{21}$ or $\frac{1}{6}$ of 7854; or by multiplying the area of a great circle by $\frac{1}{6}$ of the diameter. 2. When the generating ellipse revolves about its longer or major axis, the spheroid is *oblong* or *prolate*; when about its less or minor axis, the spheroid is *oblate*. The earth is an oblate spheroid, that is, flattened at the poles, so that its polar diameter is shorter than its equatorial diameter. (See EARTH.) The spheroid in this condition does not touch the surface of the metal, but floats on a layer of its own vapour, and evaporates rapidly from its exposed surface. It is heated mainly by radiation from the hot surface, because conduction is impossible since the layer of intervening vapour conducts heat very feebly. The formation of a layer of non-conducting vapour explains why it is possible to dip the wetted hand into molten iron with impunity.

1. The common name of animals of the Linnean genus *Aranea*, now divided not only into many genera, but into many families, constituting a section (Araneida) of the class Arachnida, order Pulmonaria. The head and chest are united to form a segment known as a cephalothorax; no wings are developed, and breathing is effected by means of pulmonary or lung sacs. Spiders are remarkable for spinning webs for taking their prey and forming a convenient habitation. The abdomen of the spiders is unfemurated, and is furnished with from four to six cylindrical or conical mammillæ or processes, with fleshy extremities, which are perforated with numberless small orifices for the passage of silky filaments of extreme tenacity, with which they form their webs, and which proceed from internal reservoirs. The legs number four pairs, and no antennæ are developed. Their mandibles are terminated by a movable hook, flexed inferiorly, underneath which, and near its extremity, which is always pointed, is a little opening that allows a passage to a venomous fluid contained in a gland of the preceding joint. After wounding their prey with their hooked mandibles, they inject this poison into the wound, which suddenly destroys the victim. A very great diversity exists in the modes in which spiders construct their webs, and in the situations in which they are placed. Some spiders do not catch their prey by entangling them in their webs, but roam abroad in search of them.

Weaves tedious snares to trap mine enemies. *Shak.*

Spinozism (spi-nō-ziz-m), *n.* The system of philosophy of Baruch Spinoza, who was born in Amsterdam in 1632 of a Jewish Portuguese family, and died at the Hague in 1677. This system is based on the idea of an original substance embracing all existence, substance in this sense meaning something very different from what we usually understand by the word. This original substance, in which all antagonism between mind and matter, liberty and necessity, &c., ceases, all subjects of finite consciousness disappear, he called God; by which he understood that which has an independent existence, and the understanding of which does not require the idea of anything else. This substance is infinite, and might also exist; it is incapable of creating anything material or intellectual, for all matter and mind are comprehended in itself; its attributes are infinite thought and infinite extension. God, this all-embracing being, can act only in accordance with the established order, for otherwise we must suppose him capable of a change of nature, or that there exists a nature different from his own. Thought and extension, spirit and matter, finite and infinite, motion and repose, good and evil, causes and effects, are attributes of this sole substance, which produces nothing but modifications of itself. All that exists is only a necessary succession of modes of being in a substance for ever the same.

Spiral (spī'ral), *a.* [Fr *spiral*, from *L. spira*, a coil, a spire. See SPIRE.] 1. Winding round a fixed point or centre, and continually receding from it, like a watch-spring. See the noun.—2. Winding round a cylinder or other round body and at the same time rising or advancing forward, like a cork-screw; as, the column in the Place Vendôme at Paris is divided by a *spiral* line into compartments; a whirlwind is so named from the *spiral* motion of the air.

Where upward, in the mellow blush of day,
The noisy bittern wheeled his *spiral* way.
Longfellow.

They are generally present among the other vessels of plants, and in trees are found chiefly in the medullary sheath surrounding the pith. The fibre coils either from right to left, or the reverse, somewhat in the manner of a corkscrew. The fibre may be single or double, or it may be composed of numerous threads. Their function is supposed to be that of the conveyance of air. They are very seldom found in the root or bark of wood, but are frequently abundant in the other parts, especially in the leaves and flowers. They are easily discovered on breaking asunder the leaves and stalks of many plants, when the fibres may be unrolled, and present themselves as delicate filaments like the threads of a cobweb. The woodcut shows (1) a compound spiral vessel; (2) three simple spiral vessels.—*Spiral wheels*, in mach. a species of gearing which serves the same purpose as bevel-wheels, and is better adapted for light machinery. The teeth are formed upon the circumference of cylinders of the required diameter, at an angle with their respective axes, when the direction of the motion is to be changed. By this construction the teeth become in fact small portions of screws or spirals winding round the cylinders, whence the name. Wheels of this kind are used when the two shafts require to pass each other; when the shafts are in the same plane bevel-wheels are employed.

Spiral (spī'ral), *n.* 1. In geom. the name given to a class of curves distinguished by this property, that they continually recede from a centre or fixed point, while they continue to revolve about it. The moving point is the *generatrix* of the spiral, the fixed point is the *pole* of the spiral, and the distance from the pole to any position of the generatrix is the *radius vector* of that point. Spirals receive different names from the properties by which they are characterized, or from their inventors; as, the *spiral of Archimedes* (see ARCHIMEDEAN); the *hyperbolic spiral* (see HYPERBOLIC); the *logarithmic spiral* (see LOGARITHMIC); the *loxodromic spiral* (see LOXODROMIC); the *parabolic spiral* (see PARABOLIC); &c.—2. Spire (spīr), *n.* [In senses 1 and 2 from *L. spira*, a spiral, the base of a column, from Gr. *speira*, a spiral line, something twisted. G. *spier*, a little point or sharp end; D. *spier*, a spire or blade of grass; Dan. *spire*, a germ, a sprout; *spier*, a spire (in arch); Icel. *spira*, a spar. 2. A term applied collectively to the convolutions of a spiral shell, which are placed above the lowest or body whorl, whatever shape it may assume.—3. 'With glistening *spires* and pinnacles adorn'd.' Milton.

Utter your jubilee, steeple and *spire*! Tenneyson

The earliest spirals, in the architectural sense, were merely pyramidal or conical roofs, specimens of which still exist in Norman buildings. These roofs, becoming gradually elongated and more and more acute, resulted at length in the elegant tapering spire; among the many existing examples of which, probably that of Salisbury is the finest. The spirals of mediæval architecture (to which alone spirals are appropriate) are generally square, octagonal or circular in plan; they are sometimes solid, more frequently hollow, and are variously ornamented with bands encircling them, with panels more or less enriched, and with spire lights, which are of infinite variety. Their angles are sometimes crocketed, and they are almost invariably terminated by a finial. In the later styles the general pyramidal outline is obtained by diminishing the diameter of the building in successive stages, and this has been imitated in modern spirals, in which the forms and details of classic architecture have been applied to structures essentially mediæval. The term spire is sometimes restricted to signify such tapering buildings, crowning towers or turrets, as have parapets at their base. When the spire rises from the exterior of the wall of the tower without the intervention of a parapet it is called a *broach* (which see).—4. A stalk or blade of grass or other plant.
